Brand New Book ***** Print on Demand *****.Excerpt from Forest Products Laboratory: Supplementing Exhibit of the United States Forest Service at the Brazil Centennial Exposition, Rio De Janeiro, Brazil, 1922-1923 A knowledge of the physical properties of wood is of importance to almost every industry using wood and is essential in kiln drying, impregnation with preservatives, distillation, and other treatments. These physical properties include density, shrinkage, transfusion of moisture, hygroscopicity, specific heat, heat conductivity, heat of absorption of water in wood, and permeability of wood by liquids and gases. It is often necessary for financial reasons to reduce the time required properly to season wood by open-air drying. Moreover, for many purposes it is desirable to dry the wood more thoroughly than is possible in the open air and to employ conditions which will reduce its hygroscopicity, or tendency to shrink or swell. For these reasons dry kilns are almost universally employed for high-grade lumber, and frequently even for the poorer grades. In the drying of hardwoods it is estimated that about 10 percent of the material dried is either ruined or lowered in grade. Much of this loss could be avoided by proper methods and kilns, and the present results might be greatly improved in other respects. Establishing Scientific Principles. The Forest Products Laboratory bases all its kiln-drying practice on fundamental studies to determine the principles underlying the transfusion of moisture through wood, the effect of changes in atmospheric conditions upon the rate of transfusion, the effect of various methods of drying and of various drying treatments upon the properties of the wood being dried, and similar studies. Drying Schedules. A comprehensive series of experiments is being conducted to determine the proper drying...
